

Ghost Effects Warmjet V

Thank you for purchasing a Ghost Effects Warmjet V, based on the very rare WEM Project V.

Controls.

Volume = The circuit can get loud, keep this down at first and adjust to taste depending on how the circuit is biased.

Edge = All the way up is the raw fuzz sound, as you turn it down you bring in a filter.

Attack = Turn up for more fuzz, all the way down loses the signal.

Biasing.

The sweep of the externally side mounted 'Texture' bias is set by the internal 'Gain' bias.

I set it up so that a little bit of noise comes in with the 'Texture' bias at the top of its travel.

Power.

Use a 9V DC negative tip adaptor or a battery, the pedal can be daisy chained with any negative ground pedals.

Warranty.

Full lifetime warranty provided minus postage and parts costs.
